Background

MPAs

- Marine Protected Areas (MPAs): Spatial management of fishing effort
- Areas $> 250,000 \text{ Km}^2$ are Large Scale (LSMPAs)¹
 - Industrial fishing largest human activity in pelagic environment²
 - Recent widespread implementation, unknown implication for fisheries

¹Toonen et al. 2013.

²Gray et al. 2017.

LSMPAs

- Erroneously assumed to have little social implications due to their remoteness³
- *Blue paradox* shows preemptive fishing⁴:

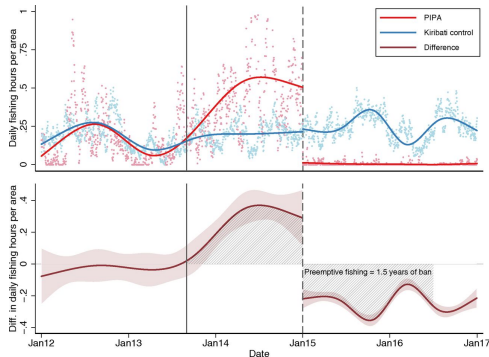

Figure 1: Preemptive fishing due to MPA implementation (Modified from McDermott et al (2018))

Models range from *cookie-cutter* approach to spatially explicit reallocation of fishing effort based on habitat characteristics:

- All these focus on the long term equilibrium⁵
- Resource users may show idiosyncratic responses⁶
- Redistribution of fishing effort may not be optimal, especially over the first years⁷
- Not accounting for fisher's behavior may lead to unexpected outcomes⁸

⁵White et al. 2013.
⁶Cabral et al. 2017.
⁷Stevenson, Tissot, and Walsh 2013.
⁸Smith and Wilen 2003.

- Phoenix Island Protected Area
 - Belongs to Kiribati
 - Implemented in 2015
 - Kiribati is part of the PNA, along with other 8 countries

Two groups:

- Treated
 - Vessels who fished inside PIPA at least once before closure
 - Continued to fish elsewhere after implementation of PIPA
- Control:
 - Vessels never fished within PIPA waters
 - Vessels belong to other PNA countries
 - Vessels have fished in surrounding areas (*i.e.* PNA-countries' EEZ) before and after PIPA closure
- Over 45 million individual AIS messages (positions)

Change in vessel-level behavior with a DiD

$$y_{i,t} = \alpha + \beta_1 Post_t + \beta_2 Treat_i + \beta_3 Post_t \times Treat_i + \epsilon_{i,t}$$

- $y_{i,t}$ monthly fishing hours by vessel i in time period t
- $Post_t$ before-after PIPA dummy
- $Treat_i$ treatment dummy
- β_3 is our DiD estimate
- month, flag, year controls

Recap

Displacement
of fishing
effort by Large
Scale Marine
Protected
Areas

Juan Carlos
Villaseñor-
Derbez¹, John
Lynham²

Background

Questions

Methods

Preliminary
results
(Focusing on
purse seiners
for now)

- Treated vessels fish less post-implementation
 - Only significant for purse seiners
- EEZs receive proportionally more fishing effort than before
 - Proportional change increases with proximity to PIPA

Future work

Displacement
of fishing
effort by Large
Scale Marine
Protected
Areas

Background

Questions

Methods

Preliminary
results
(Focusing on
purse seiners
for now)

Change in behavior

- Distance traveled
- non-fishing at-sea hours
- proportion of fishing / searching

Spatial redistribution

- Proportion is bounded, might try a binomial GLM
- Measure of “crowdness”

Concerns

- Spillover effects / treatment affecting control
